

Photozyme MD Review: The Secret to Achieving Optimum Skin Health?

CACI International Launches Revolutionary System in London

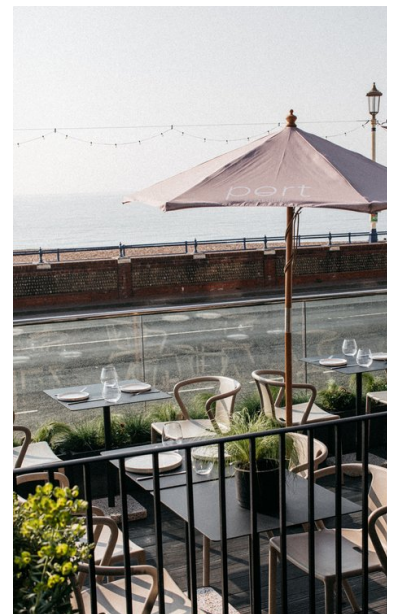

The new facial system debuts all new technology at prominent London clinic, Lisa Franklin Clinic Privé. Discover the world-renowned label now.

Beauty editing comes with a large dose of cynicism.

There are brand launches aplenty every month but rarely anything new of note once you read between the lines of great marketing.

Here's where we step in: Societe reviews each product as they come through our doors and few reach our pages - unless we have something great to say about them.

So when a product range comes along and finds its way into the bags of us beauty editors, it's probably one to invest in.

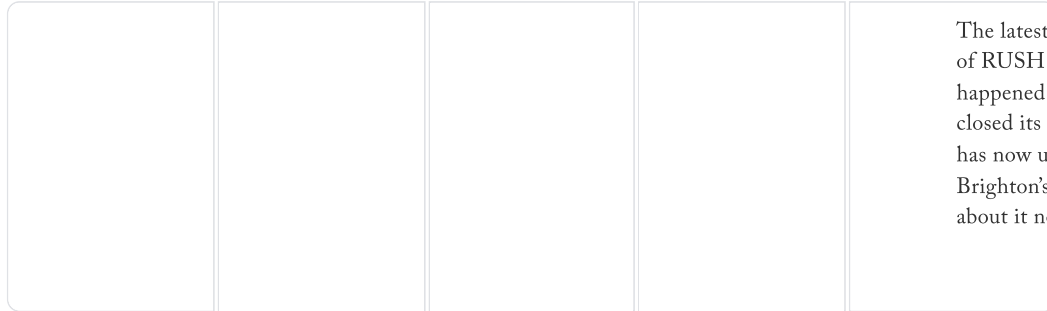

Port Hotel in Sussex Launches All New Al Fresco Terrace

Photozyme MD products contain DNA repair enzymes, helping to amplify antioxidants and SPF for further protection against photodamage and ageing.

According to leading dermatologists, DNA repair enzymes are considered to be fundamental pillars of a healthy skin care regimen.

Photozyme MD Review: The Secret to Achieving Optimum Skin Health?

When a product range comes along and finds its way into the bags of us beauty editors, it's probably one to invest in. One such example is Photozyme MD; a little-known label whose focus is on innovative and proprietary skincare products that enhance and maintain skin health.

WHAT IS DNA ENZYME TECHNOLOGY

Photozyme products utilize a targeted delivery of natural repair enzymes called *DNA Enzyme Technology* to help prevent the signs of skin aging from surfacing.

As ingredients in our products, it's SPF's, antioxidants and DNA repair enzymes that play an essential role in healing our skin.

You'll want to look for retinoids and AHAs (Alpha-hydroxy acids) as a secondary beneficial addition and peptides and growth factors as a third and final (but important!) element. Ask a skincare professional for advice on some of the [products to help you achieve your best skin](#).

THE PRODUCTS

Photozyme MD has a small but unique collection of revolutionary products: a serum, a DNA rich cream, a cleanser and an SPF.

The star products for us are a potent combination of the Gentle Probiotic Cleanser, Youth DNA Serum, iQuad Total Eye Therapy Serum and Ultra Rich DNA cream.

Keeping to a regimented skin routine is essential when sampling new products. It takes on average 28 days to see the new skincare label's effect on the skin.

THE RESULTS

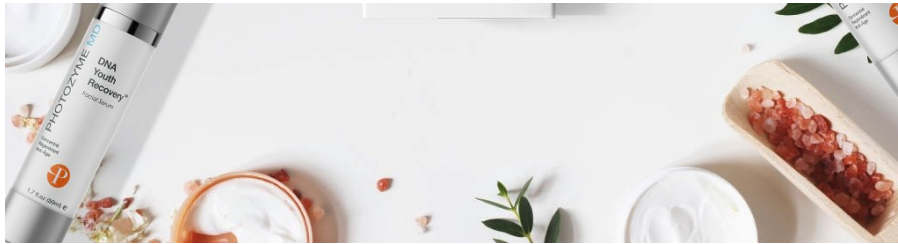

After 30 days of using Photozyme's hero products, fine lines on the forehead, skin suppleness and pigmentation had all improved. This skincare line targets the fine lines around the eyes and on the forehead and is well worth the investment long term.

Adhering to a regimented skincare routine when using new products is essential to learning its efficacy on the skin (specifically yours).

Morning and night, apply one pump of the Probiotic Cleanser (suitable for all skin types, particularly acne patients) to the palm of the hand and massage into the face.

The natural scent of the cleanser is reminiscent of a relaxing spa day, so be sure to rest and take deep breaths when applying.

Wipe away with a cotton pad (notice the dirt you'll clean off) and apply a pump of the Youth DNA Serum (contains three DNA repair enzymes with additional antioxidant protection), iQuad Total Eye Therapy Serum and Ultra Rich DNA cream (contains the three DNA repair enzymes as well as being rich in antioxidants and fatty acids) - in that order.

The thickness of the cream is the ideal sealant prior to the application of the other products and acts as the last line of defence against dryness.

IN CONCLUSION

Over 80% of skin damage comes from UV light (radiation) and is associated with skin burning and skin cancers. Photozyme MD helps slow down skin ageing as it holds off collagen degradation in the lower layers of the skin, therefore, helping to reduce the appearance of fine lines and wrinkles and has a non-comedogenic, paraben-free formulation.

Before: 217 UV Spots

After: 12 Weeks: 64 UV Spots

Photozyme MD compliments all skincare regimens and attacks both past and present damage as seen above in before and after images of a patient with serious sun damage.

Several studies have proven that sunscreen is not enough by itself to prevent sun damage. DNA repair enzymes such as Photolyase, a key ingredient in Photozyme products, are imperative to prevent damage.

Prioritising skin health should be an essential part of our routine each day. Sun damage affects us all and SPFs simply aren't enough to protect the skin in the long term.
